

A short trip through NE Spain and the Pyrenees.

23rd to 28th of July, 2012

Originally planned to last longer, we had to cram this trip into six days, including two days of hard travelling on the French motorways. That added a lot of species for the “highway-list”. The main focus was to visit different areas in the North-Eastern corner of Spain, not too far from the home base at Arens de Lledo in the Matarrana region of Aragon.

Three completely different areas of interest to birders are found within a 100 km radius:

- the Ebro delta, an area of wetlands, rice paddies and open water. It lies next to the sea, so marine birds are present as well.
- the plains and steppes between Belchite and Lleida, dry, dusty with a definite Mid West USA look. For some species this is a northernmost stronghold in Spain.
- and the Els Ports mountain range. An area of dry crags and lush valleys, springing surprises from time to time.

We spent the first three days birding the Ebro valley and delta and the Els Ports. Then travelling back to the Netherlands we had the choice between more coastal areas, like Emporda, Cap Creus and Camargue or the higher mountains of the Pyrenees. In the end we opted for the latter, we had already seen quite a lot of birds that we would meet again along the coastal route. It proved to be a lucky choice as well as a good one. The day we left for the North, the tinder dry bush and forest on the Costa Brava became an inferno, killing at least four people. The motorway AP-7 was blocked for a long time and that alone would have necessitated a long detour anyhow. On the steppes and in the mountains nothing burned and we suffered no setback at all. Taking into account that July is not the best month of the year to spent in some of the areas we still managed to find a reasonable number of species. Best time of the year would be between mid April and beginning of June. Warm not hot, no more roads barred because of snow, longer daylight, and outside the tourist season.

Travel schedule for the visits and return trip:

Date	
23/07/2012	Fontcalda, Els Ports, Caspe Gandesa, Fontcalda, Prat de Comte Valderribles, Monroyo, Alcaniz Caspe, Maella, Mazaleon
24/07/2012	Ebrodelta Vulture roost between Prat de Comte en Xerta Encanyissada, Tancada Riet Vell, Riumar Mirador de Canal Vell
25/07/2012	Flix, Els Ports Ebro shores, Flix (Sebes) Corbera d'Ebre, Gandesa, Bot Prat de Comte, Roques de Benets
26/07/2012	From Arens de Lledo to Aisa Alcaniz, Hajar, Belchite, Embalse de Sotonera Riglos, Mirador de Buitres Jaca

27/07/2012

From Aisa to Orleans

Val de Araguez, Val de Hecho
Val de Anso, Val de Roncal
Isaba, Belagua.
Bordeaux, A10 past Angouleme, Tours
Blois

28/07/2012

From Orleans to Amsterdam

Via Parijs-A1-Lille, past Gent and Antwerpen
past Breda, Gorinchem and Utrecht

I had driven to Arens de Lledo from the Netherlands some ten days before. Via Paris, Clermont Ferrand, Beziers, Perpignan. Then - as a planned recce- a detour over the Coll d' Ares, Lleida, Flix to Arens de Lledo. This route normally requires two times 10 hours of driving, 12 hours if you include some stops. Highlights along the route were :

- Tens of Red Kite in the central part of France, between Montlucon, Clermont Ferrand and Beziers. We see these every time we travel that route, they are more numerous than Black Kite on that stretch.
- Montagu's Harrier above a wheat field north of Orleans.
- Booted Eagle near Lleida (Catalan for Lerida, a name that can be found almost everywhere in the Spanish speaking parts of this world).
- Flamingoes in the corner of your eyes, at 110 km per hour from the motorway between Beziers and Narbonne.
- The first sounds of Bee Eater again while at a resting stop near Ripoll, Spain.
- Flock of Red Legged Partridge, flying low over the car on the Coll d' Ares.
- Lesser Grey Shrike near Lleida.
- Blue Rock Thrush opposite the village of Arens de Lledo.
- Griffon Vultures flying over the Finca (our farm) in Arens de Lledo. Rock Bunting, Golden Oriole and Red Rumped Swallow visible from the terrace.

On Thursday, on the way to collect my fellow traveller at the Barcelona airport, I drove to the Garraf, ticking off Pallid Swift.

Mediterranean Gull, some Rose Ringed Parakeets, Cattle Egret and the continuous "tsjeep... tsjeeptsjeep" of Zitting Cisticola were seen near the delta of the Llobregat river. Feral doves and Tree Sparrows did neither react to 737's flying just 50 meters overhead on final approach, nor to the tip vortex/backwash that would howl over after about 30 seconds.

Site information.

Garraf. Approach from the south: A good possibility to see Pallid Swift is from the narrow coastal road between Sitges and Castelldefels, but only a few small, dirty, parking lots are available there. Drive in the direction as mentioned (S -> C), this eliminates the necessity to cross the busy road twice at each stop, when you walk towards the viewpoints. At the end, almost back at sea level, you'll reach a roundabout, which allows entry into the Garraf if you go across towards Rat-penat.

Approach from the north: The way up into the Garraf mountains when coming from the Barcelona airport is from the C32 road leading from Castelldefels towards Sitges. Leave the road using exit 42 to the right just before the main road disappears as a tollroad into the first tunnel. Keep right. Go left on the roundabout towards Rat-penat, "Garraf" is indicated as well.

Both approaches have now joined: Go past the barrier towards the housing estate, take the second exit right (effectively going straight on) on the roundabout and start climbing. The road is very steep at some stretches, first gear. Open areas above, at 300-plus meters altitude, give easy views on the Pallid Swifts and assorted swallows

during the warmer months. Bonelli's Eagle is the other specialty that can be found here, I did not see it there. Do not go into the area near the military radar station. The signposts are clear and the military are not known for being good humoured.

Flix (Sebes Reserve). Leave the village of Flix by the C12, crossing the bridge over the Ebro. About 100 meters past the bridge turn left and return on the road parallel to the road you used, not on the C12. Just before the bridge you'll see a sign indicating the Reserve. It stretches for several kilometres along the northern shore of the Ebro. At 2.6 km, next to the Education Centre is a boardwalk, leading to two hides. In summer the first one on the left does not really have a view. The second one at the end looks out over a shallow pond, and might have views of the river in winter. We saw Kingfisher, several Penduline Tit, Greenfinch, Rufous-tailed Scrub-Robin and Spotted Flycatcher. R-tSR was positively identified, cocked rufous tail, ending in white and black, lines on head. It was visible while foraging in the lower branches of some shrubs for about a minute. It is not given as "present" at any time in the leaflet that is distributed by the Reserva. Lars Jonsson does not indicate its presence in the area either. Cramp in 'Handbook of the Birds of Europe, the Middle East and North Africa' indicates that the species reaches the lower stretches of the Ebro.

Vulture roost near Xerta. Just north, upstream along the Ebro river, of Xerta the N250 road to Prat de Comte and Valderobles branches of the Tortosa to Mora d'Ebre road, C12. After about 4 km, a big pig-farm, low double storey, multi-windowed comes into view on the right hand side. On the left a turnoff is evident, leading into a narrow valley. Park the car a.s.a.p. In July the vultures leave at about 10.30AM. No nests were visible. About 50 Griffon and 2 Egyptian vultures used the roost. If you go further up that road, you'll reach a working stone quarry, check for warblers on that stretch. We did not go any further, because the road seemed to be impassable.

Roques de Benets. From the T330 road leading from Prat de Comte to Valderobles take the turn left at km 16.5 You will by that time already have seen the buttresses of the RdB. After 2 kilometers there is a viewpoint on the left. It has a memorial plate commemorating five firemen that were killed in the 2009 forest fires. The bright side are the views on a nice waterfall, only when it has rained recently, and Alpine Swift at lightning speed. You can hear the wind over their wings. Short-toed Eagle often soars here. Continue on the road, past a well with very good cool drinking water. The valley then narrows and at 4.7 kilometers take the gravel road left. At 5.9 km another turn left. There is a barrier during the hotter months. The best way is to continue on foot. The path leads past the foot of the steep rockfaces. Wallcreeper has been reported from this site. We saw Griffon Vulture and Raven. The sheer walls on the opposite side of the valley have roosting and nesting Vultures as well.

The next five areas can be visited consecutively in one day. You might also split your visit in a two day trip, southern and northern parts of the Ebro Delta.

L'Encanyissada. Easily accessed from the south. Use the local TV3408 road from Ampostà to Sant Carles de la Rapita. Just before reaching the last village a road turns to the left, signposted "Poble Nou", "Irtà". (Coming from Sant Carles, follow the boulevard, keeping the sea to your right. Just after the marina you'll see the TV3408 road. After the small white buildings, turn right.) This road leads between rice paddies, saline marshes and canals with different salinities. Upon reaching Poble Nou take the left fork, first road to the left, around the perimeter of the village to the right, first left. You'll soon cross a bridge with a hide next to it. Park on the right. The other hide can be found by continuing the road you have been using, turning right at the end, after one kilometre a big hide can be seen. The box next to it is a roost for up to 5000 bats. Little Bittern, Purple Gallinule, Squacco-, Night-, Purple- and Grey Herons. Both Little and Great Egret. Red Crested Pochard, Whiskered Tern. Flamingo. Warblers in the reedbeds.

Tancada. From the last hide continue on the same road. To the left and the right is "New Nature", landscaped for no economic purpose. At the end of the road turn right. After 1.5 km turn left, continue on this road until you'll see disused saltponds on both sides. By now you will already have seen Audouin's Gull, Black-Necked Stilt, waders, some herons and Whiskered Tern. In the pond area more waders can be found. Curlew, Bar-tailed Godwit, Redshank. Terns like Sandwich', Little and Gull-billed. Mediterranean-, Yellow-legged, Black-headed and Herring gulls. To go on continue on the same road until you reach a crossing. The road straight ahead leads onto the beach, use it if you want to saltspray your car, or walk it to get a chance for Cory's shearwater, Lesser Crested Tern, Gannet and Shag

passing by. Turn left to get to a hide after about 700 meters. Continue on the same road, watch for Pratincoles over and on the ground, to reach....

Riet Vell hide. Just outside the holiday village of l' Eucaliptus. On the left hand side of the southern road coming from Els Muntells, just before the road coming from the previous site (Tancada), not more than 150 meters from the village. Cross the concrete bridge, park on the right. Then walk the path towards the farm building, turn left before the big shed, and right again. You will then see the hide. Purple Gallinule, waders, breeding Common Tern, Night Herons and Pratincole. Barn Swallows House- and Sand Martin congregate in the reeds.

A new bridge between Sant Jaume d'Enveja and Deltebre makes a quick connection to the northern part of the delta. Some interesting areas can be found there as well.

Riumar. The village itself is a few streets of holiday misery, deserted apart from during the summer season, some restaurants on the boulevard. The good thing about it is that it has a beach which slopes only slightly, so it is safe for those that do not master swimming. If you face the sea, you'll find a marshy area at the righthand end of the boulevard. On the beach stands a kind of watchtower, which might be at your perusal when it is not busy. The marsh normally holds a collection of ducks, waders, the odd flamingo, and terns that use the airspace above it. If you go left on the boulevard you'll reach a sandy road at the end, it is often hard enough to drive a car on. Old mussel holding ponds on your left only carry water during the colder months, but do often have Slender-billed Gulls and waders at such times. Over the sea, look for terns, Gannet and shearwaters, we did not see any this time. After about one kilometre you can reach tarmac again to further investigate the rice paddies nearer to Deltebre

Mirador de Canal Vell. On the road from Deltebre to Riumar turn left (North) at km-mark 15. Continue until the road makes a righthand turn. Immediately after the turn there is a small parking lot on the left. Leave the car there and walk further north along the walkpath lined by trees. The platform is clearly visible. From the observation deck you can look over rice paddies, a row of low bushes and a shallow marshy lake. The rice paddies will have a different set of birds present, depending on the growing season. Waders, herons, terns and gulls are guaranteed. The red legs that are black-necked are obvious. Audouins' Gull is frequently seen as well. The row of bushes holds roosting herons and egrets. On the lake you'll be able to see Flamingo, Red-crested Pochard, Glossy Ibis and Caspian Tern. We did not see the latter, by the way, but previous visits gave that result.

Two places we did not visit on this trip into the Ebro Delta were: The sandspits to the north (Fangar) and south (Banya)of the delta. These are good for waders and any birds linked to mud and water. In the week before our visit even a African Laughing Dove (*Streptopelia senegalensis*)had been seen near the saltpans on the southern end. But mind you, that one is about 20 kilometers to the end, the northern tip to the Fangar lighthouse is about ten kilometres. So you'll have to check on fuel, water, and road-, weather- and sea conditions. Having to push your car through loose sand with a dry throat is epic, but uncomfortable.

Nearer Ampolla is a dirtroad that reaches a viewpoint as well. From the boulevard: Follow the coast as closely as is allowed, keeping the sea to your left. At one time a campsite is on your right. At the next roundabout keep following the coast. You are now on the dirtroad. If you park here, take all valuables or lock them safely in the boot. A smashed window and theft is a spoiler on every trip, however good the birding. In front is a concrete watchtower, often unused and available. To the right of the road a walking path starts that allows access to a viewing screen and a hide next to Bassa les Olles. The array of birds to be expected is similar to those at the Mirador de Canal Vell, some five kilometres away as the Caspian Tern flies.

The way back.

Albalate del Arzobispo to Lecera road. A223. Dry areas at both sides of the road. We chanced into Golden Eagle but had squadrons of Black Kite and Griffon Vultures as well. This is where a Black-bellied Sandgrouse flew over.

Belchite. The Planeron area is to be reached by branching left from the CP9 road to Quinto, some 4 kilometers after Codo. The turnoff is signposted. Follow the gravel road. Sandgrouse of both kinds can be found here. A Spanish guy offered us the use of a hide for photographing, next morning at seven. He had made a kind of waterhole, which he showed us, it was being used at that moment by a Pin-tailed Grouse. The road continues, and at one stage links up with a gravel road to Quinto again after having been clay-surfaced for about half a kilometre. We do not advise to try it after any amount of recent rain. The clay looked the sticky kind that clogs up your wheel arches. It had not rained so we challenged our luck and forced our way through. Use a compass. Northern and Black-eared Wheatear, Lesser Short-toed Lark. Kestrel and Montagu's Harrier.

Sotonera. Between Zaragoza and Huesca, take the turnoff at Almudevar, go west on the A1207, just south of the Canal de Monegros. We saw Booted Eagle, Raven, Crow, both Red- and Black Kites and Goldfinch along this road. The Embalse, lake behind the dam, held far off gulls, one closer by was identified as Herring Gull. Reaching it at about 2PM in summer does not help with clear views, everything is shimmering. We went around the east side of the lake to go towards the next area.

Mirador de Buitres. Take the A132 out of Huesca towards the NW. At Ayerbe turn right, towards Loarre. After about 4 km turn left towards Sarsamarcuello, the Mirador is by now indicated as well. Keep following the signs, having made sure that your brakes are OK. Going up is steep, so going down is steep as well. At one moment, going up, you'll go past the remains of a hermits' place or a monastery on your left. Continue, keep left on the fork and you'll reach a small parking lot. It is next to the hide, vultures everywhere: Griffon, Egyptian and Bearded or Lammergeier. The village of Riglos lies in front of the hide at the foot of the 300 meter sheer walls of Los Mallos. Alpine swift, Crag Martin.

Val de Aragües. We overnighted at Aisa, a pretty, little village with a few Hostals. Continuing west you have to make a few guesses on which way to choose. We were fortunate and reached Jasa. But then we made a navigational error: instead of following the river downstream we went upstream, into the Val d'Aragües. Lucky mistake, Citril Finches everywhere. The road ends where the mountain walkers begin. When going back we noticed how eager they are to start walking, they drive speedily on a road that is not really wide. We reached the Val de Hecho, then turned left in the village of Hecho itself and climbed over a ridge into the Val de Anso. Here we turned right (North). At Anso we started climbing over the next ridge reaching the Val de Roncal. Mistle Thrush and Red-backed Shrike were seen a few times.

Val de Roncal / Belagua. The Val de Roncal connects with the French road system on the Belagua, so it was a logical choice. It will be difficult to cross or even be closed during several months in winter because of snow. Skiing areas are found on both sides. We saw Alpine Marmot and heard them whistling. A large number of black spots had caught our attention. They were performing aerobatics, interspersed with some feeding on the ground. We went up higher and they came down lower, so we came close enough to identify them as Yellow-billed Chough. We were surprised to see the longer red bills of Red-billed Chough as well. Double whammy.

A day and a half were thus spent collecting ticks for the list. Nowhere did we stop very long, an hour at the Mirador was the longest stop we made. We feel that we could easily have spent a full day in each of the sites mentioned above, increasing the number of species observed. But employers, kids and spouses have their own agenda and we had to fit into that. Katrina, as our Tomtom is affectionately named, guided us through some unexpectedly nice countryside. We hit the autoroute north of Bayonne and then made it to Orleans in the early evening. A thirteen hour day ended with a celebratory meal.

List of species ever recorded in Spain, adapted from a list on the WICE website. *Some species were added by us (in italics)*. The list also indicates which ones we saw on which days. Apart from their Spanish names sometimes synonyms in other Spanish speaking countries are given (Cr = Caribbean, HN= Honduras, Arg = Argentina etc.).

Robert de Groot, Finca Rafiki Birdwatching, tel +31 6 23349842 email: robertandtanja@cs.com

Website www.finca-rafiki.eu will be on air shortly.

In 1981, I went for the first time to some of the areas described. Since 2004 I am a regular visitor, often for weeks and sometimes for up to five times a year. Since 2010 I lead tours for FlevoBirdWatching in the Netherlands. Now on offer are tours, tailor-made, for individuals or small groups, one or more days in the Netherlands, France and/or Spain.

You can also contact FlevoBirdWatching via their website: www.birdsnetherlands.nl
